### ECTOPARASITES OF MAMMALS FROM OREGON

Charles G. Hansen<sup>1</sup>

Ectoparasites from 451 small mammals were collected while making an ecological study in the Steen's Mountains area in Harney County, Oregon. The mammals were captured in snap-traps, and individuals of the same species were placed in plastic bags and etherized to kill their ectoparasites. The bags and carcasses were then examined for invertebrates. Ectoparasites were placed in small vials containing 70 per cent ethyl alcohol and labeled as to place, date, collector, and host. The mammals and number examined are listed below.

> Sorex preblei Jackson, 1 Sorex vagrans monticola Merriam, 8 Sorex palustris navigator (Baird), 6 Myotis lucifugus carissima Thomas, 2 Myotis volans interior Miller, 3 Lasionycteris noctivagans (Le Conte), 1 Antrozous pallidus cantwelli Bailey, 12 Mustela frenata nevadensis Hall, 2 Citellus beldingi crebrus Hall, 3 Citellus leucurus leucurus (Merriam), 3 Citellus lateralis trepidus (Taylor), 3 Eutamias minimus scrutator Hall and Hatfield, 1 Eutamias (amoenus and/or minimus), 23 Thomomys talpoides quadratus Merriam, 3 Perognathus parvus parvus (Peale), 6 Dipodomys ordii columbianus (Merriam), 24 Dipodomys microps preblei (Goldman), 1 Onychomys leucogaster fuscogriseus Anthony, 11 Peromyscus maniculatus sonoriensis (Le Conte), 211 Neotoma lepida nevadensis Taylor, 5 Neotoma cinerea alticola Hooper, 4 *Microtus montanus montanus* (Peale), 53 Microtus longicaudus mordax (Merriam), 46 Lagurus curtatus pauperrimus (Cooper), 11 Zapus princeps major Preble, 6 Ochotona princeps taylori Grinnell, 1 Sylvilagus nuttalli nuttalli (Bachman), 1

Assistance was given by P. W. Oman, and identification of the parasites was made by C. F. W. Muesebeck, E. W. Baker, A. Rud-

<sup>1.</sup> Desert Game Range, Las Vegas, Nevada.

nick, and A. Stone of the Insect Identification and Parasite Introduction Section of the United States Department of Agriculture; and by F. C. Bishopp and R. I. Sailer of the Oscar Johnston Cotton Foundation at Brownsville, Texas. Mounted and unmounted specimens of the parasites are housed in the United States National Museum and the Oregon State University entomological museum.

Identification of the hosts was made by the author in the field at the time of collection. Consequently, separation of the two species of *Eutamias* was not attempted where their ranges overlapped, and these are referred to in the tables as *Eutamias* sp.

I am indebted to Drs. D Elden Beck and Dorald M. Allred, Zoology and Entomology Department of Brigham Young University whose encouragement and assistance aided greatly in the preparation of the manuscript.

Tables 1 to 5 present the species and numbers of individuals of each parasite and their host relationships. When only the genus, family or order are given, the parasite represented an undetermined species, or a specialist was not available to make specific identifications of that particular organism.

#### DISCUSSION

Analysis of the tables reveals several interesting host-parasite relationships. Mice of *Microtus montanus* possessed the greatest number of species of mites of any mammal studied. These mice also were next in frequency to deer mice, *Peromyscus maniculatus*, with reference to the numbers of species of fleas they possessed. Although more hosts of these two species were examined than other mammals, sufficient numbers of some of the others were taken to be indicative of their parasite fauna.

Most parasites were not widely distributed in relationship to host species. and when found on more than one or two hosts usually were found only in small numbers. A few, however, were widely distributed and in some abundance. These were the mites *Haemoga*masus ambulans and *Haemolaelaps glasgowi*, tick *Dermacentor an*dersoni, and fleas *Catallagia decipiens*, *Megabothris abantis*, *Meringis* hubbardi, and Monopsyllus wagneri.
